My Research Topic

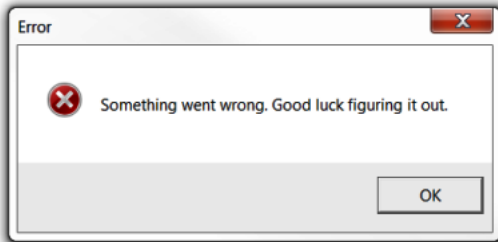

During my MRes course, I plan to research the influence of Korean Pop (Kpop) within Japan.

You can find advertisements for Kpop all around Tokyo, but where is the research on this phenomenon?

The Problem with Excel

What happens if data is missing?
What happens if you need to look at a specific section of the
data you have collected?

You might end up wasting a lot of valuable time trying to solve
these problems.

Pros
Cons

Conclusion

Initially, I had several areas where using a digital tool could improve the flow and pace of my work.

- Compiling sources for literature research
- Analysis of survey data
- Transcription and Translation of Interviews
- Writing and formatting my final Thesis

Out of these four areas, I considered survey data analysis to be the most time-consuming, so I decided to work on saving time here through implementing a digital tool.

Results

Pros
Cons

Conclusion

In order to choose the correct tool to use, I had to refine my input and output sources. These went through many iterations, but eventually ended up like this:

- Input: Raw data collected from an online survey site that is capable of producing both qualitative and quantitative data and presenting it in a CSV format.
- Output: A dataset that can receive queries for specific subsets, answer these queries and plot the results in a graphical format.

Due to my choice of input and output, I was able to pick R as my intended tool-of-choice.

Implementation

Creating a Tool Chain

To begin with, I needed to prove that R could take a basic .csv input and create my desired output. To do this, I created my own small table of data, before loading it into the R environment and constructing a plot.

This tool chain was a success, so I was then able to continue onto using more complex data, in a similar style to what I intended on using in my final thesis.

Implementation

Elaborating on my Chain

Now I knew that my tool chain worked with simple data, created a more complicated chain.

Google Forms survey (real-world data collection)

→ Data analysis in R

→ Graph imported into a Word document

The survey was completed by my FOAR705 class. With this new data I created a tabular database that could answer all the questions I asked.

Results

Pros
Cons

Conclusion

Results

Cons:

- R support online is often outdated for the current version (code changes)
- Time is still currently an issue in terms of utilising this tool - however, I would say that if R is implemented properly, there will likely be fewer problems concerning data breaking under manipulation.

Conclusion

So far, my implementation of R as a tool for data analysis; taking simple raw csv data from online survey sites and producing clear graphical data for word processing and typesetting software has been successful. It still remains to be seen if I can effectively manipulate more complicated data. However, I am confident that with this technical skillset I have learnt in the process of undertaking my Proof of Concept, I will be more prepared to solve potential problems with my data, and will have saved time that will be valuable elsewhere during my MRes course.
